

Patient: Brandon D.O.B. 10/13/2005

Diagnosis: Brain Damage

On June 7, 2007 our Brandon suffered a traumatic event. He was diagnosed with hypoxia of the brain. The hypoxia caused Brandon to lose most of his abilities. Our family did extensive searches about all the possible ways to help Brandon. After going to several countries and speaking with numerous doctors we decided that stem cell therapy with Dr. William Rader was our best option.

We brought Brandon to have stem cell therapy with Dr. William Rader on February 23, 2008. Since his procedure we have seen many improvements in Brandon's daily activities.

Some of these are:

- Removal of his feeding tube
- Sits up better/ for longer periods of time
- Holds head up better
- Lays on stomach
- Flips over
- Slight signs of vision
- Able to drink from a straw
- Able to chew a cookie
- Attempts to sit up from laying position
- Much more alert
- Recognizes voice

We are very grateful for the new positive changes we are seeing every day in our wonderful Brandon.
